

log

compresse les échelles

$\sqrt{}$ *rétablit l'unité*

σ *interrupteur doux*

x^2

amplifie les écarts

x^n

creuse le contraste (n grand)

$\exp(-x)$

escompte, sans s'annuler

$$\exp(-x^2)$$

la cloche : plateau puis chute

cos, sin

boussole : mesure un alignement

$a \cdot b$

accord brut = part alignée

arctan

direction → angle (quadrant perdu)

arctan2

retrouve l'angle, quadrant compris

arctan : 45° pour les deux (faux) — arctan2 lit les signes

max / min

retient l'extrême, jette le reste

$|\cdot|$

ampleur sans signe

$1[\cdot]$

juge binaire : oui / non

a / b

mise en proportion (sans échelle)

même proportion, tailles différentes

$C = 4\pi \cdot A / P^2 \rightarrow$ le rapport efface la taille

softmax

scores $\rightarrow$ probabilités (somment à 1)

$\exp \div \Sigma$

A red arrow pointing from the 'scores' chart to the 'probabilities' chart.

probabilités ($\Sigma = 1$)
